Anleitung zur Benutzung des General-Formelregisters 1).

Das General-Formelregister ist nach dem von M. M. RICHTER 1884 begründeten System angeordnet (vgl. M. M. RICHTER, Lexikon der Kohlenstoff-Verbindungen, 3. Aufl., Bd. I [Hamburg und Leipzig 1910], S. 2 sowie STEIZNERS Literatur-Register der Organischen Chemie, Bd. I [Braunschweig 1913], S. VII). Es werden also die mit C verbundenen, häufiger vorkommenden Elemente in der Bruttoformel nach der Reihenfolge:

aufgeführt. Die übrigen Elemente reihen sich daran in der alphabetischen Folge ihrer Symbole.

Die Anordnung richtet sich

- a) in erster Linie nach der Zahl der Kohlenstoff-Atome
- b) in zweiter Linie nach der Anzahl der neben Kohlenstoff im Molekül vorkommenden anderen Elemente
- o) in dritter Linie nach der Art des neben Kohlenstoff im Molekül vorhandenen Elements im Sinn obiger Reihenfolge
- d) in vierter Linie nach der Atom-Anzahl dieses einzelnen Elements
 - e) in fünfter Linie nach der Art des in der Bruttoformel an dritter Stelle stehenden Elements
 - f) in sechster Linie nach der Anzahl seiner Atome, usw.

Im General-Formelregister sind sämiliche Verbindungen unter der ihnen zukommenden Bruttoformel aufgeführt. So sind z. B. die Methylester und Äthylester von Carbonsäuren, die in Stellners Literatur-Registern der Organischen Chemie wie auch in den Formelregistern des Chemischen Zentralblatts unter der Bruttoformel der betreffenden Carbonsäure gebracht werden, unter ihrer eigenen Formel zu finden. Die Salze von Ammonium-, Oxonium-, Sulfonium-, Jodonium-usw. -Basen sind stets unter der Formel des betreffenden Hydroxyds aufgenommen, also Tetramethylammoniumchlorid unter Tetramethylammoniumhydroxyd C₄H₁₉ON.

Beim Zusammentreffen mehrerer Isomeren unter ein und derselben Bruttoformel sind die einselnen Stichworte entsprechend ihrer Konstitution nach dem Benterens-System geordnet²).

9) Dies trifft auch für einige Verbindungen vollkommen bekannter Konstitution zu, die im Belistein-Handbuch keine Namen erhalten haben, sondern nur als "Verbindung" bezeichnet worden

sind.

¹⁾ Des vorliegende General-Formelregister umfaßt die Bände I.—XXVII des Hauptwerks und ersten Erginsungswerke (1.—8. Abteilung des Beilstein-Systems). Die 4. Abteilung des Systems (Raturstoffe) erhält ein eigenes Generalregister.

Umwandlungsprodukte¹) ohne Konstitutionsangabe²) finden sich nach Band- bezw. Seitenzahlen geordnet am Ende jeder Isomeren-Reihe.

Für die Anordnung der Isomeren nach ihrer Konstitution gilt diejenige Formel, die der Einordnung der Verbindung im Beilstein-Handbuch zugrunde gelegt ist. Änderungen in der Konstitutions-Auffassung, die nach der Berichtsperiode des Beilstein-Handbuchs erfolgt sind und auf die im Werk nicht mehr Bezug genommen werden konnte, haben also im Formelregister keine Berücksichtigung gefunden.

Registrier-Verbindungen ohne eigenen Text, die nur zur Kennzeichnung der systematischen Zugchörigkeit der nach ihnen folgenden Derivate dienen, sind nicht aufgeführt.

Für die Benennung der Isomeren mußte im Interesse der Übersichtlichkeit eine Auswahl unter den im Beilstein-Handbuch aufgeführten Namen getroffen werden. Hierbei wurde der Hauptwert auf leichte Verständlichkeit gelegt. Es wurden daher vorzugsweise die in der Literatur gebräuchlichsten Namen gewählt. Im Interesse leichter Verständlichkeit wurden ferner solehe Genfer Radikal-Bezeichnungen (z. B. Methoäthyl, Methoäthenyl, Äthylon), die sich nicht allgemein eingeführt haben, in der Regel durch gebräuchlichere Bezeichnungen ersetzt. Die Namen im Formelregister stimmen also in einigen Fällen nicht genau mit den im Handbuch aufgeführten Namen überein.

Fur die Reihenfolge der Wortbestandteile in zusammengesetzten systematischen Namen diente als Grundlage die im Hauptwerk, Bd. I, S. 941 abgedruckte Rangordnung der Präfixe (Liste von häufig vorkommenden Elementund Radikal-Bezeichnungen).

Präfixe und definierende Zusätze sind nur in wenigen Fällen weggelassen, so stets die Präfixe Mono- und Peri-, sofern sie nicht als Bestandteile von Vulgårnamen vorkommen, und in den meisten Fällen die Bezeichnungen d-, l-, dl-, racem.- sowie die definierenden Zusätze rechtsdrehend, optisch inaktiv, nicht spaltbar.

Die Bandzahlen sind durch Fettdruck hervorgehoben; eingeklammerte Seitenzahlen verweisen auf das Ergänzungswerk.

Bei Stichworten aus Doppel- und Dreifachbanden des Ergänzungswerks steht nur die Bandzahl des Hauptwerkbandes, zu dem der zitierte Teil des Ergänzungsbandes gehört; vgl. die nebenstehende Tabellc.

¹⁾ d. h. Verbindungen, die wegen unbekanoter oder zweiselhaster Konstitution im Handhuch nicht systematisch eingeordnet, sondern als Anhang zu den Ausgangsmaterialien gehracht sind.
2) Umwandlungsprodukte mit Konstitutionsangahe sind gemäß der Systemstelle eingereiht, die der angegehenen, wenn auch zweiselhasten Konstitutionsformel entspricht. Ihre Behandlung unterscheidet sich also in kelner Weise von der Behandlung von Verbindungen hekannter Konstitution.

Seitenzahlen der Doppel- und Dreifachbände des Ergänzungswerks.
